1. Your ID = AB-CDEFG-H. Convert the letter G into 8-bit ASCII code, where the 8-th bit can be considered as a zero. Illustrate the graph of the digital bit stream for the following scheme:
 - I. Unipolar NRZ and Unipolar RZ
 - II. Polar RZ, Polar NRZ-L, Polar NRZ-I
 - III. Bipolar Manchester ('0' is low to high & '1' is high to low) and Bipolar Differential Manchester
 - IV. Bipolar AMI and Bipolar Pseudoternary
 - V. Multiline Transmission (MLT-3), given that the last voltage level is zero and last non-zero level is positive
2. Compute the 8-bit data stream for each case depicted in figure 1. Assume, that the last signal level was negative.

Here, $G_1 = 3$ (ASCII character) = 33 (Hex)
 = 00110011 (binary)

last nonzero level is positive

Ans to the Q. NO-2

1) NRZ-I the last signal level was negative.

Computed data stream for NRZ-I = 11001101

Theme:

11) Differential Manchester: the last signal level was negative

0 No inversion: want bit 1 1 Inversion: want bit 0

Computed data stream for Diff. Manchester is = 11001101
